## Taller 4. Integración

Juan José Gaitan - 201912484 Juan Duniel Rodríguez - 201921704

## Punto 2

Encontrar el error para regla de trapecio simple.

Error a sociado al procedimiento de interpolación

Suponiendo que  $f^{(x)}$  es continuo y derivable de cluse  $C^2$  en el intervalo  $f^{(x)} = P_1(x) + E(x)$ , donde  $E(x) = \int_{-2}^{\pi} (\xi) (x-a)(x-b)$  con  $a \le \xi \le b$ 

Error  $\rightarrow E = \int_{a}^{b} E(x) dx$ 

$$E = \int_{a}^{b} \frac{f^{\pi}(\xi)}{2} (x-a)(x-b) dx = \underbrace{f''(\xi)}_{2} \int_{a}^{b} (x-a)(x-b) dx$$

$$E = \int_{a}^{a} \left( \xi \right) \int_{a}^{b} \left( x^{2} - bx - ax + ab \right) dx$$

$$E = \int_{-2}^{11} \left(\frac{\xi}{\xi}\right) \left[ \frac{\chi^{3}}{3} - \frac{b \chi^{2}}{2} - \frac{\alpha \chi^{2}}{2} + \alpha b \varkappa \right]_{a}^{b}$$

$$E = \int_{-2}^{11} \left( \frac{\xi}{3} \right) \left[ \left( \frac{b}{3} - \frac{b^{3}}{2} - \frac{ab^{2}}{2} + ab^{2} \right) - \left( \frac{a^{3}}{3} - \frac{ba^{2}}{2} - \frac{a^{3}}{2} + a^{2}b \right) \right]$$

$$E = \frac{\int_{0}^{11} \left(\frac{\xi}{6}\right) \left[ \left(-\frac{b^{3}}{6} + \frac{ab^{2}}{2}\right) - \left(-\frac{a^{3}}{6} + \frac{a^{2}b}{2}\right) \right]$$

$$E = \frac{f''(\xi)}{2} \left( \frac{-b^3}{6} + \frac{3ab^2}{6} + \frac{a^3}{6} - \frac{3a^2b}{6} \right) = \frac{f''(\xi)}{2} \left( \frac{-b^3 + 3ab^2 + a^3 - 3a^2b}{6} \right)$$

$$E = \int_{12}^{11} (\frac{\xi}{4}) \left(-b^3 + 3ab^2 + a^3 - 3a^2b\right)$$

$$E = f''(\xi) (a-b)^3 = -f''(\xi) (b-a)^3$$
  $N = -f''(\xi) (b-a)^3$ 

El error asociado a la integración por el metab del tropecio con h=b-a  $E = \int_{a}^{b} \mathcal{E}(x) dx = -\underbrace{\int^{\parallel} \left(\frac{x}{\xi}\right)}_{12} \left(b-a\right)^{3} = -\underbrace{\int^{\parallel} \left(\frac{x}{\xi}\right)}_{12} \left(h\right)^{3}$
